

HaloGLS, HaloCandle and HaloSpherical lamps

Halogen Lamps

HaloGLS 20W, 30W, 42W, 53W, 70W and 100W

HaloCandle 20W, 30W and 42W

HaloSpherical 20W, 30W and 42W

Product information

GE's Retrofit Halogen Lamps are direct replacements for regular incandescent lamps offering a crisp white light.

Features

Available in standard GLS, candle, spherical and reflector shapes, these lamps are the environmentally friendly solution for those who prefer the features and light quality associated with incandescent bulbs.

- Last twice as long and consume up to 30% less electricity than corresponding incandescent lamps.
- Provide instant-on, full light output at start-up and lumens are maintained throughout the life of the product.
- Unlike some compact fluorescent products, they are 100% retrofit with the incandescent lamps they replace.
- Can be used with dimming switches.
- Environmentally friendly with no lead or mercury.
- Up to 2,000 hours life
- Excellent colour rendering, light close to natural (100% CRI)
- More than 90% lumen maintenance over life

Application areas

Home

Hospitality

Product range

GLS lamps are available in a full range of:

- 20, 30, 42, 53, 70 and 100 wattages
- Cap E27 and B22

Candle lamps are available in a full range of:

- 20, 30, and 42 wattages
- Cap E14, E27, B15 and B22

Spherical lamps are available in a full range of:

- 20, 30, and 42 wattages
- Cap E14, E27, B15 and B22

IEC Standards

GE tungsten halogen lamps comply with the following international standards where applicable:

- IEC 60432-2 Tungsten Halogen Lamps Safety Standard,
- IEC 60357 Tungsten Halogen Lamps Performance Standard,
- IEC 60061 Lamp Caps & Holders – Part1: Lamp Caps

GE imagination at work

HaloCandle lamps

HaloSpherical lamps

Tungsten halogen principle

The filament of the incandescent lamp is replaced with a halogen inner burner. The burner builds up from a tungsten filament enclosed in a gas filled quartz bulb, together with a controlled quantity of halogen. At the operating temperature some tungsten evaporates and migrates to the cooler areas of the bulb wall where before it can be deposited, it combines with the halogen to form a tungsten halide. This circulates until it comes near the filament where the halide dissociates and deposits the tungsten back on the filament. This cycle continues throughout the operating life of the lamp. As the bulb wall remains clean the bulb size can be reduced considerably by the use of quartz which can withstand the high wall temperatures required by the halogen cycle. The small bulb and strong materials withstand much higher working pressures, this reduces filament evaporation, thus offering increased performance either as more light or longer life.

- 1. Tungsten evaporation
- 2. W- halogen reaction at bulb
- 3. Halogen returns to filament
- 4. Halogen returns to cycle

Bulb remains clear, "hot-spot" forming delayed

Light, life & Voltage

For any particular lamp, the light output and life depend upon the voltage at which a lamp is operated. For instance, as approximations, the light output of incandescent replacement halogen lamps varies as the 3.7th power of the voltage and the life varies inversely as the 9th power of the voltage. The chart below illustrates the effects of overvoltage or undervoltage applied to lamp on its power, life and light output. The values given are reasonably valid between 70% and 130% rated voltage. Since the halogen cycle is optimized at rated voltage, a certain degree of bulb blackening occurs at overvoltage. The chart applies only for A.C. operation. The life may be reduced for lamp operation on half-wave rectified or D.C. voltage because of a harmful unidirectional tungsten diffusion within the coil. Phase-splitting semiconductor dimming devices have no reducing effect on life.

UV radiation

The hot filament emits only a small amount of energy in the UV range according to the blackbody radiation. The soft glass outer bulb of the lamp blocks all UV radiation of the filament, just like in case of a traditional incandescent lamp. This results that the UV levels are much below the international standards. It means that even in the case of very high illumination levels, the use of these lamps has no harmful effects to material and living being at all.

End-of-life behaviour

The technology applied for the inner burners provides extremely safe end-of-life behaviour. Since the burner does not contain additional metal parts, the risk of high current arcing when a lamp burns out is essentially eliminated. In addition fuses are built in the lamp to ensure smooth end-of-life behaviour.

Operation and Maintenance

- Store and use the lamps the same way as traditional incandescent lamps.
- Fuse is not required in circuit.
- Observe wattage limitations of your fixture.
- Bulb wall temperatures in operation are high and therefore lamps should not be operated in flammable atmospheres unless enclosed in suitably rated luminaires.
- Lamps should be kept free from contamination.
- Good condition of the lampholder contacts is important to ensure proper operation of lamp.
- Ensure lamp is cool before removing.
- Do not use the lamp if the outer jacket is broken, even if the burner still operates. There is a risk of electric shock.
- Rapid cycling can shorten lamp life and designers should take advice from their GE Lighting representative before using these lamps in flashing or blinking applications.
- The lamps may be dimmed by reducing voltage. However, this may cause the bulbs to blacken. If this occurs the lamp should be run at full voltage for fifteen minutes, thereby clearing the problem.
- Switch off mains supply before installing/removing lamp.
